

AI FAKE NEWS DETECTOR!!

- We are the last group today in this panel today(hopefully)
- So I am not going to bore you again with the “*why an AI-powered fake news detector is required*”:
 -
 - simply because it was mandatory.

- Before I begin anything let me tell you why we chose this topic, and as you are already guess:
- *ChatGPT told us that this topic one was the one that required the least effort out of all the other topics and u can easily make prototype overnight.*

Before you ask, we know that you have seen
23432523 teams present that same topic of AI
Fake News Detector.

What is so different about yours?

~~Nothing~~

Just kidding!!

THREE DISCLAIMERS

#1: I'm not an expert, I also don't have any real clue how news work so don't use any of this information as fact. I promise you, if I knew what I was doing, I would be making zillions of dollars on Wall Street, but alas, I'm not!

#2: Most of these topics are more complex than I have time to properly explain—so, do your own research! Do your own reading! It's better to understand these concepts on your own than just blindly follow what I say in this presentation!

**#3: WE WILL NOT BE TALKING ABOUT LLMs
BECAUSE I THINK THEY ARE OVERHYPED
AND WEIRD AND I ACTUALLY DESPISE THEM**

I cannot tell you what the others did because the others didn't tell us what they did even after we asked them.

BUT what I can do is tell u the problems we faced while we were building this.

Traditional college projects usually work like this:

- **Download a Kaggle CSV**
- **Train a model**
- **Predict FAKE or REAL**

PROBLEM?

The model only knows old data.

WHAT MAKES OUR SYSTEM DIFFERENT??

Our system does NOT depend only on training data.

INSTEAD:

It depends on something called “RAG”

What is RAG?

Retrieving relevant data and generating accurate, context-aware responses to improve AI outputs.

R

Retrieve

Find useful information

A

Augment

Add it to the AI's knowledge

G

Generate

Create a better response

What Problems does RAG solve:

- 1. Hallucinations**
- 2. Outdated Information**
- 3. Contextual Relevance**
- 4. Domain Specific Knowledge**

Our prototype. Please feel free to use it on your own device!!.

Proposed Solution

Live Web-Augmented Generation

VeritasAI replaces static AI generation with a highly targeted **Live WAG architecture**.

The system actively scrapes real-time data from a strict whitelist of trusted journalistic and government sources (e.g., PIB India, AltNews). It combines advanced **Computer Vision (Tesseract OCR)** for extracting embedded text from images, providing an evidence-backed, explainable verdict (Fake, True, Unclear).

Technical Architecture

Frontend Interface

Built with HTML5, JavaScript, and Tailwind CSS. Features a responsive, glassmorphism design hosted on GitHub Pages.

 Server racks or cloud computing abstract concept, light theme

Backend Infrastructure

Containerized Python and FastAPI backend. Hosted on Render for scalable, high-performance API routing.

AI & OCR Engine

Utilizes Groq API for rapid LLM inference, Tesseract/Pillow for precise OCR, and BeautifulSoup4 for live web scraping.

How It Works

Feasibility & Viability

User Adoption

VeritasAI is entirely web-based, requiring zero installations or complex setups. The intuitive interface ensures high compatibility across mobile and desktop devices, minimizing the learning curve for non-technical users.

Technical Scalability

By leveraging the Groq API, we achieve unparalleled LLM inference speeds, resolving the latency bottlenecks typical of traditional AI deployments. Our OCR pipeline is specifically optimized for heavily compressed messaging app images.

Personal feedback:

- 1. First how could I have improved my presentation, knowing the fact that several other teams before me had already done the same thing?**
- 2. What were you expecting from us as a team?**
- 3. Any technical issues, please guide us.**

Thank you.
